

SDGs Alignment of Indonesia’s Research Strength

Arief Anshory Yusuf

Indonesia’s universities publish a great deal on the SDGs. The question is whether they publish on the goals their own provinces are failing.

METHOD

How alignment was measured

Supply and demand are ranked over the same 16 goals for each of the 34 provinces, then compared.

1	Supply	Scopus publication counts per SDG for 457 Indonesian universities, attributed to the province the university sits in. Each province's five strongest goals are its supply.
2	Measured demand	285 official indicator-dimensions from the National SDGs Secretariat, normalised and aggregated by principal component analysis into a 0–100 achievement index per goal. Each province's five weakest goals are its demand.
3	Stated demand	A survey of provincial Bappeda fielded 25 February – 14 March 2025 and answered by 27 of the 34 provinces — agency heads, division leaders and planners — setting out each province's own declared priorities, implementation constraints and existing university partnerships. Complemented by focus group discussions with local governments, universities and operating SDG Centers, and by content analysis of all 34 provincial RPJMDs.
4	Alignment	A goal on both the supply and demand lists is a match — a development gap the province's own universities are already strong in.

FIGURE 1

Where universities are strong, where provinces are failing, and what provinces say they want

All 16 goals, ordered by the gap between revealed demand and supply. Demand is measured twice, from two different sources.

Supply — a top-5 university strength Revealed demand — a bottom-5 achievement Stated demand — survey priority rank

Province by province, goal by goal

■ Both — strength meets need
 ■ Supply only
 ■ Need only
 ■ Neither
